

$$12. \forall a \in G, |a| = |a^{-1}|,$$

$$\therefore |a| = k > 2 \text{ 时, } a^k = e, a^{-k} = (a^{-1})^k = e.$$

故阶大于2的元素是成对出现的.

$\therefore$ 有限集中阶大于2的元素个数为偶数

$$13. \text{ 设群中元素个数为 } 2n, \text{ 阶大于2的元素个数为 } 2k,$$

$$\therefore \text{ 阶为1和2的元素个数为 } (2n - 2k).$$

又 $\therefore e$ 是唯一的1阶元素,

$$\therefore \text{ 阶为2的元素个数为 } (2n - 2k - 1) \text{ 为奇数}$$

$$14. \text{ 设 } |a \cdot b| = m, |b \cdot a| = n,$$

$$\therefore b \cdot (a \cdot b)^m \cdot a = b \cdot e \cdot a = b \cdot a.$$

又左边 $= (b \cdot a)^{m+1}$. 左右同右乘 $(b \cdot a)^{-1}$ 得:

$$(b \cdot a)^m = e. \text{ 又 } |b \cdot a| = n. \therefore n | m$$

$$\text{同理: } m | n.$$

$$\text{综上可得 } m = n. \text{ 即 } |a \cdot b| = |b \cdot a|$$

$$1. \forall a, b \in H \cap K, a, b \in H \wedge a, b \in K,$$

$$\therefore H \leq G \wedge K \leq G. \therefore a \cdot b^{-1} \in H \wedge a \cdot b^{-1} \in K.$$

$$\therefore a \cdot b^{-1} \in H \cap K. \text{ 故 } H \cap K \leq G.$$

$H \cup K$ 不一定是 G 的子群. 反例:

$$G = \langle \{0, 1, 2, 3, 4, 5\}, +_6 \rangle, H = \langle \{0, 2, 4\}, +_6 \rangle,$$

$$K = \langle \{0, 3\}, +_6 \rangle. H \cup K = \langle \{0, 2, 3, 4\}, +_6 \rangle \text{ 不是群.}$$

$$5. \text{ 设 } h \in \mathbb{Q}^{\mathbb{Q}^*}, f \text{ 为同构函数.}$$

$$\therefore \mathbb{Q}^*, \mathbb{Q} \text{ 的单元元分别为 } 1, 0$$

$$\therefore h(1) = 0.$$

$$\text{又 } h(1) = h[(-1) \cdot (-1)] = h(-1) + h(-1) = 0.$$

$$\therefore h(-1) = 0 = h(1).$$

$\therefore h$ 不为双射, 故不存在这样的同构函数
